

Does Your Safety Plan Consider Lightning?

Insights

7.23.13

The headline, [nine workers struck by lightning](#), tends to grab one's attention. As a longtime Scout leader, I take lightning seriously, but my sense is that most workers do not. Periodically I see employers investigated because of a complaint to OSHA alleging that construction workers or saw mill employees or some other group are exposed to lightning hazards. The following incident reminds us to take this concern seriously and to take steps to ensure that employees take the threat seriously:

Nine People Struck By Lightning In Wellington At Grant Family Farms

By Beano July 18, 2013 5:08 PM [share on Facebook](#) [share on Twitter](#) The storms rolling across Larimer County this afternoon are packing quite a wallop. We're hearing reports of flooding, road closures and mudslides in Rist Canyon and in the High Park burn area, a flash flood warning for central Larimer County until 6PM, as well as scary news of ten people getting struck by lightning in Wellington. (Reports are now saying nine people were hit, not ten.)

According to CBS Denver,

"Nine farm workers were struck by lightning north of Wellington on Thursday afternoon.

The Wellington Fire Chief said the workers were in the Grant Farms area.

At least two of the workers were rushed to the hospital in critical condition.

You can see more coverage of the story in the CBS News video below.

A quick Google found articles asserting that 1000 Americans are struck each year, with around 100 dying, and over 24,000 a year struck by lightning worldwide. These figures may be exaggerated but the concern is real. I found over 118 entries in the last few years when I searched lightning-related fatalities [on OSHA's site](#):
